

Graphical Interface

Lab 1: Recovering Deleted Files

Create a new text file on the desktop named `lab.txt` and delete the file by selecting the file and hitting the **Delete** key. Recover the file through **Nautilus** without going directly to **Trash**.

Lab 2: Viewing Files

Find the latest modified file in `/var/log`.

Lab 3: Customize Your Desktop

Linux is so customizable that very few people who use it stay with the default look and feel of the desktop. You may as well get started now in making your desktop reflect your likes and personality. Start by changing the desktop background to something that better suits your tastes—perhaps one of the provided backgrounds, a solid color of your choice, or a personal picture that you can transfer onto your Linux environment. Next, select a theme from the available themes for your distribution that, again, suits your tastes and personality. Have fun and explore with this exercise.
